

fearmem rsa analysis

Goal of this analysis was to determine if Baseline items that were sourced as being from acquisition were more similar to acquisition items, compared to Baseline items that were correctly sourced to Baseline.

These plots are showing similarity to correctly sourced Acquisition items, as a function of what the source memory response was. either baseline (correct) or acquisition (incorrect).

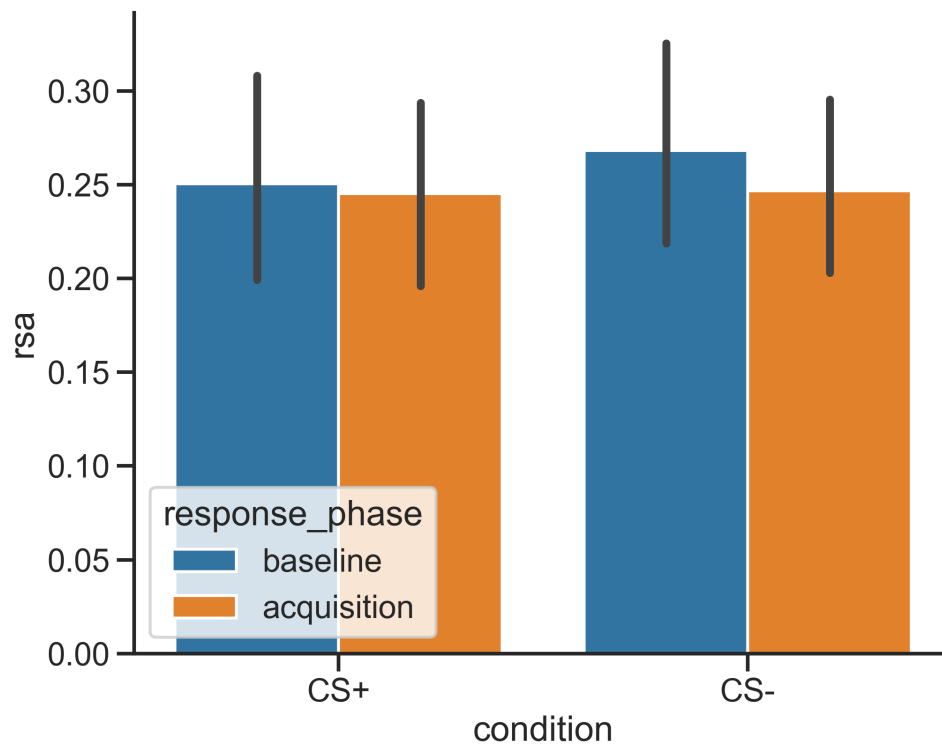

Pretty much null effect in dACC, and sub cortical ROIs, no real difference at all. Kinda a bummer considering it took a little bit of leg work to pull the right items out of the matrices

dACC

I also looked at the same analysis, but for extinction.

dACC

Again nothing in the subcortical ROIs either.

All in all, pretty big null.
